Implementation

Asset tracking systems can help MSD improve how their assets are used by providing information on their location and how they are being used. This can help optimize routes and schedules and prevent unauthorized use.

Abstract of project

This project is aimed to develop an MSD Asset Tracker System, which is essential for effective asset management within the organization. The asset tracker will enable the tracking of asset availability, ensuring that all resources are accounted for and utilized efficiently.

Functional specifications of the project

The following is a list of the functionalities of the system.

- 1. The system should be accessible to MSD Users and multiple users at same time.
- 2. UI is expected to be interactive and user friendly.
- 3. Assets shows the result in Single page.

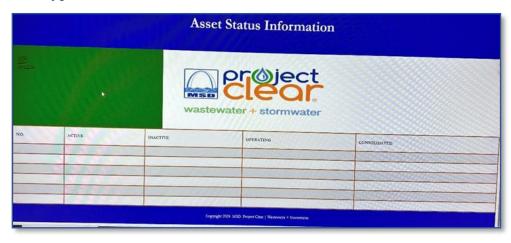

UI Design

Considering the needs and expectations for this project the goal is to create interfaces which users find easy to use and pleasurable. Including informational components, interactive elements, visual elements, and containers.

Mockup

	Asset Status Tracker									
Sno.	Feature N	Featyre Type	Active Sta	Abandone	Removed	Consolida	Design	Operating	To Be Rem	Inactive
	Manhole	SS	170101	2328						
	Inlet	SW								

Prototype

Context level DFD

Milestones and Timelines

	Milestone Name	Milestone Description	Timeline	Outcome
1	Technology familiarization	Understanding of the technology needed to implement the project.	Week 1	Advancing my skills and knowledge by creating mini projects that will ultimately converge to form the final product.
2	Database	Decide Database design.	Week 2	Stayed alongside with the database the organization currently uses (SQL developer and Oracle).
3	High-level and Detailed Design	Listing down all possible scenarios like different types of tutorials. Then coming up with flow-charts or pseudocode to handle the scenario.	Week 2	

4	Implementation of the front-end of the system	Implementation of the main screen giving the login, screen that follows the login giving various options, screens for each of the options.	Week 2/3	Used HTML coding in Visual Studio to enhance and maintain the front-end of the system.
5	Integrating the front-end with the database	The front-end developed in the earlier milestone will now be able to update the employee database. In short, the system should be ready for integration testing.	Week 3	Developed code that integrates the database with the front-end layout, ensuring seamless data flow and user experience.
6	Integration Testing	The system should be thoroughly tested by running all the test cases written for the system.	Week 4	
7	Final Review	Issues found during the previous milestone are fixed and the system is ready for the final review.	Week 5	

Technical Requirements

Technology Stack

Frontend: Visual studio code

Backend: Python (Django/Flask)

Database: MySQL, Oracle

Hosting: Google Cloud, Microsoft Edge, GoLive

Code

Python

Imports

```
from flask import Flask, render_template
import oracledb
```

Oracle database connection

```
app = Flask(__name__)

dsn = oracledb.makedsn("RJMSDDBT02","1521",service_name="gisdevl")
username="username" #Replace with your username
password="password" #Replace with your password
```

Tables from database

Query

```
def fetch_status_counts(table_name, feature_type):
    query = f""
            COUNT(CASE WHEN STATUS = 2 THEN 1 END) AS Abandoned,
            COUNT(CASE WHEN STATUS = 5 THEN 1 END) AS Design,
            COUNT(CASE WHEN STATUS = 6 THEN 1 END) AS Operating,
            COUNT(CASE WHEN STATUS = 7 THEN 1 END) AS TO_Be_Removed,
COUNT(CASE WHEN STATUS = 8 THEN 1 END) AS Inactive
        FROM MSD.{table_name}
    with oracledb.connect(user=username, password=password, dsn = dsn) as conn:
        cursor = conn.cursor()
        cursor.execute(query)
        result = cursor.fetchone()
        columns = ["Active", "Abandoned", "Removed", "Consolidated", "Design", "Operating", "To_Be_Removed", "Inactive"]
            "Feature_Name": table_name,
            "Feature_Type": feature_type,
            **dict(zip(columns, result))}
    return data
```

Table data

```
# Routes
@app.route('/')
def index():

    table_data = []

# SS Tables
    for index, table_name in enumerate(ss_table_names, start = 1):
        status_counts = fetch_status_counts(table_name, "SS")
        status_counts["S_No"] = index
        table_data.append(status_counts)

# sw Tables
    for index, table_name in enumerate(sw_table_names, start = 1):
        status_counts = fetch_status_counts(table_name, "SW")
        status_counts["S_No"] = index
        table_data.append(status_counts)

return render_template('index.html', table_data=table_data)

if __name__ == '__main__':
    app.run(debug=True)
```

HTML

Layout designs

```
<!DOCTYPE html>
